

How to Recognize one Chemical Reaction from another.

Type	Abstracts	Real examples	Thinks to remember
Synthesis	$M + N \rightarrow MN$ $X + Y \rightarrow XY$	$2\text{Na} + \text{Cl}_2 \rightarrow 2 \text{NaCl}$ $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$	<p>Two or more smaller reactants become a bigger product. AKA Combination Reaction.</p>
Decomposition	$MN \rightarrow M + N$ $XY \rightarrow X + Y$	$\text{CuCO}_3 \rightarrow \text{CuO} + \text{CO}_2$ $2\text{Al}_2\text{O}_3 \rightarrow 4\text{Al} + 3\text{O}_2$	<p>Opposite of synthesis. Start with one reactant, which breaks down into smaller products.</p>
Single Replacement (SR)	<p>Cation (metal) replacement</p> $Z + \text{BC}_{(\text{AQ})} \rightarrow \text{ZC}_{(\text{AQ})} + \text{B}$ <p>Anion (nonmetal) replacement</p> $\text{N} + \text{CA}_{(\text{AQ})} \rightarrow \text{CN}_{(\text{AQ})} + \text{A}$	$\text{Li} + \text{NaCl}_{(\text{AQ})} \rightarrow \text{LiCl}_{(\text{AQ})} + \text{Na}$ $\text{F}_2 + 2\text{NaCl}_{(\text{AQ})} \rightarrow 2\text{NaF}_{(\text{AQ})} + \text{Cl}_2$ <p>Au + HCl_(AQ) → X no reaction A “no reaction” happens when the atoms are “lower” - less reactive than the ion already in solution. Gold is less reactive than hydrogen; the Au “can’t bump” the H out of solution.</p>	<p>Start: atoms are added to a SINGLE aqueous solution. Product is new AQ and diff. atoms. Check Table F, but in every SR a new AQ forms. Find the 2/3 on Table J ♥ Which ever metal (or H) is higher, goes into solution, or stays in solution. Which ever nonmetal is higher goes into solution, or stays in solution. Switch, fix, balance.</p>

How to Recognize one Chemical Reaction from another.

Type	Abstracts	Real examples	Thinks to remember
Double Replacement (DR)	<p style="text-align: center;">$AQ + AQ \rightarrow \text{diff } AQ + \text{SOLID}$</p> <p style="text-align: center;">$\underline{A}B + \underline{X}Y \rightarrow \underline{A}Y + \underline{X}B$</p> <p style="text-align: center;">Make sure the first part, the <u>CATION</u>, stays in front. Switch the anions only.</p>	<p style="text-align: center;">These are “so big” they would not fit in this box. Example below.</p> <div style="border: 1px solid black; padding: 10px; margin: 10px auto; width: fit-content;"> <p style="text-align: center;">$2LiBr_{(AQ)} + Pb(NO_3)_{2(AQ)} \rightarrow 2LiNO_{3(AQ)} + PbBr_{2(S)}$</p> <p style="text-align: center;">$NaC_2H_3O_{2(AQ)} + AgNO_{3(AQ)} \rightarrow AgC_2H_3O_{2(AQ)} + NaNO_{3(AQ)}$</p> <p style="text-align: center;">The 2nd line is NO REACTION, 2 AQ products means a mixture, not a reaction.</p> </div>	<p style="text-align: center;">Always start with TWO AQ solutions.</p> <p style="text-align: center;">Switch, fix, balance, F'em.</p> <p style="text-align: center;">On the odd chance you end up with 2AQ products, that means it was no reaction, just a mixture forms.</p>
Combustion	<p style="text-align: center;">$HC^* + O_2 \rightarrow CO_2 + H_2O$</p> <p style="text-align: center;">No real “abstract”, you always burn a hydrocarbon and oxygen; always get carbon dioxide & water products.</p> <p style="text-align: center;">*You might start with an oxygenated hydrocarbon. Rarely you have “incomplete combustion” (insufficient oxygen), then $C_{(S)}$ or $CO_{(G)}$ forms <u>with</u> $CO_2 + H_2O$</p>	<p style="text-align: center;">$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$</p> <p style="text-align: center;">$2C_4H_{10} + 13O_2 \rightarrow 8CO_2 + 10H_2O$</p> <p style="text-align: center;">$C_{23}H_{48(S)} + 35O_2 \rightarrow 23CO_2 + 24H_2O$</p> <p style="text-align: center;">$2C_2H_5OH + 5O_2 \rightarrow 4CO_2 + 4H_2O$</p> <p style="text-align: center;">$2CH_4 + 3O_2 \rightarrow C_{(S)} + CO_2 + 4H_2O$</p>	<p style="text-align: center;">These are always exothermic, heat is a product.</p> <p style="text-align: center;">Sometimes the numbers get bigger than “normal”.</p> <p style="text-align: center;">You will always be given the formula for the HC or oxygenated HC.</p>
