$\qquad$

1. Fill in all six phases changes by their names, from solid $\leftrightarrow$ liquid, liquid $\leftrightarrow$ gas, and solid $\leftrightarrow$ gas

2. Indicate the "important" temperatures for water (at standard pressure), and all three phases.

3. A heating curve shows the specific $\qquad$ associated with the different
$\qquad$
$\qquad$ for any substance, as heat is $\qquad$ .
4. A cooling curve shows the specific $\qquad$ associated with the different
$\qquad$
$\qquad$ for any substance, as heat is $\qquad$ .
5. The necessary information for either a HEATING or COOLING curve includes the
$\qquad$ point and the $\qquad$ point.
6. $\quad$ The melting point $=$ the $\qquad$ point.
7. The boiling point $=$ the $\qquad$ point.
8. We will draw the heating curve for water. Note: you can't start the graph at absolute zero! Start the graph above 0 Kelvin to start!

Think: Title, $Y$ axis with units \& numbers, $X$ axis with words only, choose a point to start, draw line segments, the last segment gets an arrow head, Add "dots" at each segment end point, Label dots $L \rightarrow R: A B C D E F$.
9. Fill in this chart to describe what's happening at each line segment

| SEGMENT | TEMPERATURE <br> CHANGE | KINETIC ENERGY <br> CHANGE | POTENTIAL ENERGY <br> CHANGE | PHASE OR PHASES <br> PRESENT |
| :---: | :---: | :---: | :---: | :---: |
| AB |  |  |  |  |
| BC |  |  |  |  |
| CD |  |  |  |  |
| DE |  |  |  |  |
| EF |  |  |  |  |

10. Temperature is deemed hotter when the particles are moving $\qquad$ .
11. Colder temperatures indicate that the substance's particles are moving $\qquad$ .
12. The "energy of motion" is called $\qquad$ energy.
13. Skip this one.
14. What ever the Temperature does, the Kinetic Energy $\qquad$ .
15. If the temperature goes up, the kinetic energy $\qquad$ .
16. If the temperature goes down, the kinetic energy $\qquad$ .
17. If the temperature stays steady, the kinetic energy $\qquad$ .
18. During a phase change on the heating curve, segment BC , heat energy is being added at a constant rate, but the temperature (and the Kinetic Energy) stay steady. The Law of Conservation of Energy says:

Energy cannot be created or destroyed in a chemical reaction, or during a physical change, but it can be transferred.

| Potential Energy is the |  | Increasing PE |
| :---: | :---: | :---: |
| GAS | Highest <br> POTENTIAL ENERGY |  |
| LIQUID | Medium <br> POTENTIAL ENERGY | Decreasing PE |
| SOLID | Lowest <br> POTENTIAL ENERGY |  |

19. Which phase has the most potential energy? Solid Liquid Gas (circle)
20. Which phase has the LEAST potential energy? Solid Liquid Gas (circle)
21. During a phase change for $\mathrm{H}_{2} \mathrm{O}$, solid to liquid, energy is added, but the temperature remain at 273 Kelvin.

What energy increases during this phase change? $\qquad$
22. The ice has a $\qquad$ potential energy, while the liquid has a $\qquad$ PE.
23. Can both kinetic and potential energy change at the same time? $\qquad$
24. Draw the cooling curve for rubidium
cooling curve for rubidium

Think: Title, $Y$ axis with units \& numbers, $X$ axis with words only, choose a point to start, draw line segments, the last segment gets an arrow head, Add "dots" at each segment end point, Label dots $L \rightarrow R: A B C D E F$.
25. Fill in this chart to describe what's happening at each line segment

| SEGMENT | TEMPERATURE <br> CHANGE | KINETIC ENERGY <br> CHANGE | POTENTIAL ENERGY <br> CHANGE | PHASE OR PHASES <br> PRESENT |
| :---: | :---: | :---: | :---: | :---: |
| AB |  |  |  |  |
| BC |  |  |  |  |
| CD |  |  |  |  |
| DE |  |  |  |  |
| EF |  |  |  |  |

| Get this data <br> before you begin <br> then put in <br> temperature | Metal | Freezing/melting point | Boiling/condensation point |
| :---: | :---: | :---: | :---: |
|  | BISMUTH |  |  |
|  |  |  |  |

30. On one graph, draw both the heating curve for lead and the cooling curve for bismuth (!) Label both lines.

What are the characteristics of solids, liquids and gases?
31. True or False, nearly every substance can be a solid, liquid or a gas? True or False
32. An exceptions is $\qquad$ , which is a mixed solid, but combusts before it melts. All elements and nearly all compounds can be at any phase with proper temperature and pressure conditions.
33. Where do we find most element melting points and boiling points? $\qquad$
34. Where do we find the freezing points and the condensing points if we need to know them? $\qquad$

| 35 | Particle <br> Attraction | Particle <br> Movement | Particles are... | Relative <br> Density | Compressibility |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Solid |  |  |  |  |  |
| Liquid |  |  |  |  |  |
| Gas |  |  |  |  |  |

36. Draw the particle diagrams of a solid, liquid and a gas in the boxes below.

solid | liquid | gas |
| :--- | :--- | :--- |
|  |  |
|  |  |

## Gas or Air Pressure

37. Air and Gas Pressure is caused by the $\qquad$ of the particles.
38. The more collisions the $\qquad$ the pressure. If you put your balloon outside in the winter it shrinks. The cold atmosphere absorbs the energy out of the balloon gas, and the helium atoms slow down. Since they are slower, the collisions are both $\qquad$ and
$\qquad$ . This makes for $\qquad$ pressure, which makes good kids cry.
39. If you bring the balloon into a warm house, the heat "recharges" the energy in the helium, causing both
$\qquad$ and more $\qquad$ , which expands the balloons and the kids $\qquad$ again.

Gas (or air) pressure is measured in four units in chemistry. Most are weirdo, but you will learn them all. Take out table A. Write ALL four units equal to each other under table A (as shown in slides).
40. Normal or Standard Pressure is $\qquad$ atmosphere, which is shortened to $\qquad$ .
41. Or it's $\qquad$ kilopascals. Normal is abbreviated as $\qquad$ .
42. In America we use pounds per square inch units. Normal is $\qquad$ .
43. Pressure was originally measured by a device called a
$\qquad$ . Since they used mercury and a metric ruler, normal was originally determined to be
$\qquad$ by a nice
guy named $\qquad$ .

Air is always pressing on you, even if you don't feel it

A PHASE diagram will show the phase of a substance at a variety of temperatures and pressures. Let's label this phase diagram for water while we discuss it.

TITLE:

44. Point 1 is called $\qquad$
45. Point 2 is called $\qquad$
46. Point 3 is called $\qquad$
47. Point 4 is called $\qquad$
48. The dotted line represents $\qquad$
49. Draw in the arrows and ALL six phase change names now.

Take out Table H (for Happy).
50. The title for Table H is $\qquad$
51. The liquids are: $\qquad$ , $\qquad$ water, $\qquad$ acid
52. Another name for ethanoic acid is $\qquad$ or vinegar
53. Ethanol is $\qquad$
54. Propanone is a ketone. A similar, common, ketone is $\qquad$
55. Wata is $\qquad$
56. The Y axis scale in in $\qquad$ , and each box is equal to $\qquad$
57. The X axis scale is in $\qquad$ , and each box is equal to $\qquad$
58. There are 4 graphs on this table only to $\qquad$ .

Promise to look at only $\qquad$ graph at a time.
59. Vapor Pressure is

60. The can and this bottle are both examples of
$\qquad$

Heating them up could cause an
$\qquad$
due to the increasing $\qquad$ pressure.
This pressure increases because heat turns the water into steam, with higher kinetic energy, causing stronger and more
particle $\qquad$

Let's assume the air pressure in the room is normal $(101.3 \mathrm{kPa})$. We open the bottle to drink, then reclose it to turn it into a closed system. At the top of the bottle is an air gap that ALSO now has normal pressure.

If you put the bottle down in lab and the room temperature is warmer than normal, say $25^{\circ} \mathrm{C}$, what extra pressure in the top of the bottle, on top of the existing normal pressure?

Let's look at table H! (at the water curve!)
61. What is the vapor pressure for water at $20^{\circ} \mathrm{C}$ ?
62. The pressure in this gap is now $\sim$ $\qquad$
63. What is the vapor pressure if you raise the temp to $70^{\circ} \mathrm{C}$ ? $\qquad$
64. If the bottle is pressure rated to 165 kPa and you heat it up to $90^{\circ} \mathrm{C}$, what happens?
$\qquad$
$\qquad$

Let's look at these three SEALED bottles. Indicate the vapor pressures for each temperature.

Ethanol

Ethanoic Acid

Propanone
$\qquad$
$\qquad$
67. At $75^{\circ} \mathrm{C}$ $\qquad$
68. Which bottle would burst first if they are all heated up together slowly? $\qquad$
69. Once more, vapor pressure is described as:

Some liquids evaporate easier ( $\qquad$ VP) some liquids evaporate worse ( $\qquad$ VP)
70. Point 1 is called
71. Point 2 is called the
72. Point 3 is called the
73. Point 4 is called the
74. Point 5 is called the
75. Point 6 is called the

76. In fact, the curve labeled water represents $\qquad$ the $\qquad$ of water at different pressures.
77. What is the boiling point of ethanol at 70 kPa ? $\qquad$
Table H tells us the vapor pressure for these 4 liquids at different temperatures.
If you read the graph backwards. Table H also provides the boiling point of each liquid at any pressure you want it for.
78. ...What is the boiling point of ethanol at 60 kPa ? $\qquad$ ${ }^{\circ} \mathrm{C}$

79 $\qquad$ What is the boiling point of propanone at 70 kPa ? $\qquad$ ${ }^{\circ} \mathrm{C}$
80. $\qquad$ What is the boiling point of ethanol at 150 kPa ? $\qquad$ ${ }^{\circ} \mathrm{C}$
81. $\qquad$ What is the boiling point of water at 180 kPa ? $\qquad$ ${ }^{\circ} \mathrm{C}$
82. What is the boiling point of ethanol at 30 kPa ? $\qquad$ ${ }^{\circ} \mathrm{C}$

Table H can also tell us what phase the liquids are at. Pick a point, and determine if you are in front of the curve (exceeded the BP so gas phase) or behind the curve (not at the BP so liquid phase).
83. Mark point " A " at Normal pressure and $115^{\circ} \mathrm{C}$. What phase is water? SOLID LIQUID

GAS
84. Mark point " B " at 90 kPa and $95^{\circ} \mathrm{C}$, what phase is water? SOLID LIQUID GAS

85. At point 1 , what phase is propanone? $\qquad$
86. At point 2 , what phase is propanone? $\qquad$ What phase is ethanol? $\qquad$
87. At point 3, what phase is water? $\qquad$ What phase is ethanoic acid? $\qquad$
88. At point 4, what phase is ethanoic acid? $\qquad$ What phase is ethanol? $\qquad$
89. At point 5, what phase is ethanol? $\qquad$ What phase is water? $\qquad$
90. At point 6, what phase are all of these liquids? $\qquad$

## Air and Gas Pressure Conversion Math (take out table A)

91. On a cold day the air pressure in Vestal is higher than normal (cold air is more dense and it "settles" onto the Earth a bit more than usual). The pressure registers at 1.20 atm . Convert 1.20 atm into kilopascals.
92. Convert 145 kPa into atmospheres.
93. Convert 905 mm Hg into kPa .
94. Convert 31.0 kPa (pressure atop Mr. Everest) into atmospheres.
95. Convert the high pressure of 2.68 atm into pounds per square inch.
96. The maximum pressure inside an official NBA basketball is 8.50 psi , convert that to mm of Hg .

## 97. The Kinetic Molecular Theory of Gases (KMT)

What are gases, how do they stay gases, how do we understand gases?

| A |  |
| :--- | :--- |
| B |  |
| C |  |
| D |  |
| E |  |
| F |  |
| G |  |
